Task 1

Def(Linear)   Given two measurable function f and g and α, $\beta \in \mathbb{C}$. An operator $\mathcal{F}$ is called *linear* if the following identity holds true:

$$\mathcal{F}\left\{\alpha f + \beta g\right\}(x) = \alpha \mathcal{F}\left\{f\right\}(x) + \beta \mathcal{F}\left\{g\right\}(x) \tag{1}$$

Def(Shift Invariant)   Given a measurable function f. An operator $\mathcal{F}$ is called *shift invariant* if the following identity holds true:

$$\mathcal{F}\left\{S_\delta f\right\}(x) = S_\delta(\mathcal{F}\left\{f\right\})(x) \tag{2}$$

where the shift operator S_δ is defined as the following:

$$S_\delta(f)(x) = f(x + \delta) \tag{3}$$

For any given function f and small number $\delta \in \mathbb{R}$.

Note that notational convention the operation notion for any operator F, we write $F(f)(x)$ instead of $F(f(x))$. In words we apply the operator F (i.e. the functional F) to the function f. Thus is would even be possible to omit the argument x. However to make the reasoning clear, I will keep it.

Therefore, directly applying the definition from equation 3 to equation 2 we can also define the property *shift invariant* as the follwoing:

$$\mathcal{F}\left\{S_\delta(f(x))\right\} := \mathcal{F}\left\{f(x+\delta)\right\} = S_\delta(\mathcal{F}\left\{f\right\}(x) \tag{4}$$

Relying on the definitions of the equations before, equation 4 and equation 1 let I solved this task,

(a) $\mathcal{F}\left\{f\right\}(x) = e^{f(x)}$ is *not linear* and is *shift invariant*.

   Show: $\mathcal{F}$ is not *linear*

   Proof.

$$\begin{aligned}
\mathcal{F}\left\{\alpha f + \beta g\right\}(x) &= e^{\alpha f(x) + \beta g(x)} \\
&= e^{\alpha f(x)} e^{\beta g(x)} \\
&\neq \alpha e^{f(x)} + \beta e^{g(x)} \\
&= \alpha \mathcal{F}\left\{f\right\}(x) + \beta \mathcal{F}\left\{g\right\}(y)
\end{aligned}$$

   $\square$

   Show $\mathcal{F}$ is *shift invariant*

   Proof.

$$a = a$$

   $\square$

(b) $\mathcal{F}\left\{f\right\}(x) = s$ is *not linear* and is *shift invariant*.

   Show $\mathcal{F}$ is *linear*

   Proof.

$$a = a$$

   $\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(c) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(d) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(e) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(f) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(g) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

(h) $\mathcal{F}\{f\}(x) = s$ is *not linear* and is *shift invariant*.

Show $\mathcal{F}$ is *linear*

Proof.

$$a = a$$

$\square$

Show $\mathcal{F}$ is *shift invariant*

Proof.

$$a = a$$

$\square$

Task 2

Given an $m \times n$ monochromatic (i.e. there is only one color-channel) Image I. Give an algorithm how to apply box-filtering on this image. Furthermore analyse the asymptotic complexity of this algorithm.

Algorithm 1 Moving Average box filter

Input: Grayscale *Image* I with resolution $m \times n$
Output: Box filtered Image *Image* $\hat{I}$

Procedures: $getDimensions(Image)$, $zeros(height, width)$

1: $[h, w] = getDimensions(I)$
2: $\hat{I} = zeros(h, w)$
3: $r = \lceil \frac{w-1}{2} \rceil$
4: **Foreach** $Pixel \, p \in Image \, I$ **do**
5:    $contribution = 0$
6:    **Foreach** $Pixel \, p_n \in r - Neighborhood \, \mathcal{N}_r(p)$ **do**
7:        $contribution = contribution + I(p + p_n)$
8:    **end for**
9:    $\hat{I}(p) = \frac{contribution}{m \cdot n}$
10: **end for**

Remarks:

- By pixels in the Algorithm 1 we are referring to the coordinates of the pixel in the image. Therefore p corresponds to the x and y coordinates of pixel p in the Image I.

- $I(p)$ denotes accessing the pixel-(color)-values in the images at the position of the pixel p in the image I.

- $\mathcal{N}_r(p)$ denotes the neighborhood with radius r around a given pixel p. In the context of pixel-coordinates, think of it as a box-grid, centred at the pixel coordinates of p. This grid has a radius of r. This means there are r neighbors (pixel-coordinates in the grid) below, on top, on the left and on the right of p.

- Our algorithm can easily be extended for color Images by simply applying the same algorithm to each color-channel separately.

- The assumption of being provided by a m by n can easily be extended for the case when $n \neq m$. This only will affect the computation of the radius r in algorithm 1.
Computing $\lceil 0.5 \cdot \left(\lceil \frac{m-1}{2} \rceil + \lceil \frac{n-1}{2} \rceil \right) \rceil$ would be a valid option in order to compute r.

- If w (i.e. n) is odd, then $\lceil \frac{w-1}{2} \rceil$ is equal to $\frac{w-1}{2}$.

- The procedure $getDimensions$ returns the width-and height resolution of a provided Image.

- The procedure $zeros$ creates a new image with the provided resolutions.
